SUMMARY

Power Platform and Dynamics 365 Developer with 5 years of experience delivering enterprise solutions on Power Apps (Canvas and Model-Driven), Power Pages, Power Automate and Dataverse. Built a quoting platform used by 300+ users, public-facing Power Pages handling 600+ submissions a month, and multi-stage approval applications that cut manual document work by 60–70%. Plugins, JavaScript client scripting, Azure Functions and security-role design, with close stakeholder collaboration.

TECHNICAL SKILLS

Power Platform: Power Apps (Canvas and Model-Driven), Power Pages, Power Automate (cloud and scheduled flows), Dynamics 365 (Customer Engagement), Microsoft Dataverse (CDS), SharePoint Online, Business Process Flows, Business Rules, AI Builder, Copilot Studio (Power Virtual Agents), Power BI

Dynamics 365 Customization: Plugins (C#: assemblies, steps, images, Custom APIs), Plugin Registration Tool, XrmToolBox, Ribbon Workbench, Web Resources, JavaScript client scripting (formContext, executionContext, Xrm.WebApi), Canvas custom pages, Editable Grids and PCF-based views, Quick Create and Quick View forms, security roles, Table Permissions and Web Roles, managed solutions and environment ALM (DEV, TEST, UAT, PROD)

Integration and Cloud: Azure Functions (Python), Azure API Management, REST APIs, Dataverse Web API, Microsoft Graph API, custom connectors, DocuSign integration, Teams Adaptive Card approvals, Word templates and PDF generation, Azure AD / Entra ID security groups

Languages and Tools: JavaScript, C# / .NET, Python, SQL, HTML, CSS, JSON, XML, Azure DevOps, Git, CI/CD, MySQL

EXPERIENCE

Power Platform Developer, Quantam (client: Kentucky Transportation Cabinet), Remote December 2024 – Present

- Architected and delivered an enterprise license-reimbursement Model-Driven app processing about 120 requests a month, migrating a complex AgilePoint workflow into Dataverse with structured lifecycle tracking and unique request identifiers for full audit visibility.
- Engineered dual Business Process Flows (intake and approvals) with a modular JavaScript framework (stage handlers, ownership engine, guard logic, field controllers) enforcing forward-only progression, automated rework routing and owner-restricted stage transitions.
- Designed a configuration-driven stage-ownership engine (Dataverse table of stage, owner type, owner reference) that assigns approvals at runtime to users, teams or lookup-based supervisors without hard-coded logic.
- Automated end-to-end document processing in Power Automate: populate Word templates, convert to PDF, and call a custom C# PDF-merge plugin (Custom API) to combine generated forms with uploaded cost documents stored in SharePoint.
- Reduced manual document preparation and approval coordination by an estimated 60–70%, replacing fragmented email tracking with centralized, auditable reimbursement workflows.
- Deployed public-facing anonymous Power Pages (14 forms) handling 600+ monthly submissions, replacing unstructured email intake with Dataverse-driven tracking across multiple counties.
- Designed a normalized Dataverse schema with shared lookup tables for multiple intake forms, and enforced least-privilege access with security roles, Table Permissions and Web Roles for supervisors and managers per county.
- Developed Power Pages JavaScript (DOM and Web API) for dynamic field visibility, metadata-driven UI behavior and validation, reducing incomplete submissions.
- Built the Access Request Canvas app (migrated from AgilePoint) supporting self and third-party requests with dynamic approver assignment, a Power Pages path for external users, daily 9 AM approval-summary flows and post-approval Word/PDF generation into SharePoint.
- Managed the release lifecycle across four environments (DEV, TEST, UAT, PROD) with managed solutions, preventing unmanaged-layer conflicts in production.

Power Platform Developer, Crypton Technosoft (client: Dobbs Equipment, John Deere dealership), Tampa, FL June 2024 – December 2024

- Architected an enterprise quoting platform (Dynamics 365 Model-Driven app) used by 300+ users across branches and 7 corporate teams, processing 30–40 quotes a day from $10K to $1M, with role-based access mapped from Azure AD security groups to Dataverse security roles.
- Integrated the parent company's equipment build system through Azure API Management and Python Azure Functions: a custom ribbon button opens the Deere system with parameters, which posts Base64 JSON back to the function, which creates the Dataverse asset records.
- Refactored 7–8 second client-side margin and profit calculations into event-driven Dataverse plugins running under one second, making quote editing accurate and fast.
- Engineered a document-generation pipeline (Quote, PO, Recap) with custom plugin APIs and Azure Functions (HTML/CSS templating), cutting generation from 2–3 minutes to 3–4 seconds for 3,000+ documents a month.
- Implemented DocuSign lifecycle automation with envelope tracking and status sync, and a multi-stage corporate workflow with Business Process Flows and Teams Adaptive Card approvals.
- Extended Model-Driven forms with Ribbon Workbench commands, Web Resources, Canvas custom pages, Editable Grids and PCF-based subgrid views; enforced conditional locking and forward-only BPF progression with formContext, addOnStageChange and Xrm.WebApi.
- Built a scheduled Power Automate flow aggregating monthly outstanding payments by branch, notifying 100+ customers per cycle after their 30-day window and escalating undelivered emails to account and general managers.
- Designed an AI Builder document-processing flow that extracts data from 2–3 parts invoices a day into formatted Excel reports for the Parts President and branch leadership, saving 30–40 minutes of daily manual entry.

Software Engineer (Power Platform Developer), LTI Mindtree (client: Mars Inc), India January 2020 – July 2022

- Designed, developed and supported eight Power Apps applications and numerous Power Automate flows integrated with SharePoint, Dataverse and custom connectors for a large retail client.
- Delivered a Canvas store-inspection app for multi-store retail operations: account managers record inspections with camera photos and notes, then submit to the general manager with one button.
- Automated inspection reporting in Power Automate, compiling inspection data and images into PDF reports from Word templates stored in date- and region-based SharePoint folders, saving 20–30 minutes per inspection.
- Applied delegable query patterns and pre-filtering in Canvas apps to keep large inspection datasets responsive, and managed access with Azure and SharePoint security groups.
- Configured SharePoint forms, lists and workflows, authored solution documentation and demonstrated proofs of concept to stakeholders.
