DIVYA DHATHRI BIJJAM

POWER PLATFORM / DYNAMICS 365 DEVELOPER

divyabijjam0@gmail.com | +1 (786)-531-5325 | https://www.linkedin.com/in/divyadhathribijjam/ | Portfolio

SUMMARY:

Power Platform and Dynamics 365 Developer with 5 years of experience delivering enterprise-grade solutions that drive operational efficiency and business visibility. Designed and optimized high-volume CRM and workflow systems supporting 300+ users, automated complex document pipelines, and reduced manual processing by up to 70%. Combines technical depth (plugins, Azure Functions, security architecture) with strong stakeholder collaboration to deliver scalable, performance-driven platforms.

SKILLS:

Power Platform: PowerApps (Canvas and Model-Driven), Power Automate (Flows), Dynamics 365, SharePoint, Power BI, AI Builder, Power Virtual Agents, Microsoft Dataverse (CDS), Copilot Studio

Other Technologies: Plugins (Assembly, Steps, Images, Custom Api's), Plugin Registration Tool, XRM Toolbox, Azure Functions, REST API, Graph API, SharePoint Services, Restful APIs, Data Model

Programming Languages: JavaScript, .Net, Python, HTML, CSS, XML, JSON, SQL

Version & Source Control: CI/CD, Azure DevOps, GIT **Databases:** Dataverse (CDS), SharePoint, MySQL

CERTIFICATIONS:

PL900- Microsoft Power Platform Fundamentals

Google Data Analytics Professional Certificate

EXPERIENCE:

Quantam (Client: Kentucky Transport Cabinate) **Dec 2024 – Present**

Power Platform Developer

- Demonstrated expertise in the Microsoft Power Platform by delivering end-to-end solutions involving Power Pages, Dataverse, Power Automate, and PowerApps (Canvas and Model-Driven Apps) to meet business requirements effectively.
- Architected and delivered enterprise reimbursement Model-Driven application processing approximately 120 monthly requests (4–5/day), migrating a complex Agile Point workflow into Dataverse with structured lifecycle tracking and unique request identifiers for full audit visibility.
- Engineered dual Business Process Flows (Intake + Approvals) with modular JavaScript framework (stage handlers, ownership engine, guard logic, field controllers) to enforce forward-only progression, automated rework routing, and owner-restricted stage transitions.
- Designed dynamic stage ownership engine using a configuration-driven Dataverse table (Stage, Owner Type, Owner Reference) to assign approvals at runtime to users, teams, or lookup-based supervisors without hardcoding logic.
- Implemented multi-path intake logic supporting self-requests, internal-user requests (pre-approval routing), and externaluser approvals via secure Power Pages forms with parameterized access and controlled Dataverse Table Permissions.
- Automated end-to-end document processing using Power Automate to populate organizational Word templates, convert to PDF, and invoke custom PDF merge API plugin to combine generated forms with uploaded cost documents stored in SharePoint.
- Reduced manual document preparation and approval coordination effort by an estimated 60–70%, eliminating fragmented email-based tracking and establishing centralized, fully auditable reimbursement workflows across the organization.
- Architected and deployed public-facing anonymous Power Pages handling 600+ monthly submissions (20+ per day), replacing unstructured email intake with centralized Dataverse-driven tracking across multiple counties.
- Designed a normalized Dataverse schema supporting multiple intake forms with shared lookup entities and relationships, improving data consistency and eliminating redundant reference tables across environments.
- Implemented role-based access control for 2+ supervisors and multiple managers per county, enforcing least-privilege access through Dataverse security roles, Table Permissions, and Web Roles.
- Developed custom Power Pages JavaScript (DOM + Web API) to enable dynamic field visibility, metadata-driven UI behavior, and enhanced validation, improving form usability and reducing incomplete submissions.
- Automated county-based routing and multi-level approvals using Power Automate, with daily reminder notifications and 100% audit tracking to ensure accountability and traceability.
- Managed structured release lifecycle across 4 environments (DEV, TEST, UAT, PROD), enforcing managed solution deployment and preventing unmanaged layer conflicts in production.
- Architected and deployed enterprise Access Request Canvas application (migrated from AgilePoint) supporting self and thirdparty requests with dynamic approver assignment (Supervisor or Higher Authority) based on user selection and organizational hierarchy.
- Integrated secure external-user workflow via Power Pages, enabling non-internal users to update request details and upload supporting documents through controlled Dataverse Table Permissions and parameterized access.
- Engineered consolidated approval notification system using Power Automate, delivering automated 9AM daily pending approval summaries and prior-day activity reports (approved/rejected) to approvers for improved oversight and accountability.
- Automated post-approval document generation and records management by populating standardized Word templates, storing finalized documents in structured SharePoint libraries with metadata linkage to supporting documents, replacing manual form preparation and email coordination.

CRYPTON Technosoft (Client: Dobbs LLC, John Deere) **Jun 2024 – Dec 2024**

Power Platform Developer

- Designed and developed multiple applications using power platforms (PowerApps (Canvas and Model-Driven), Power Automate, Power Pages) with end-to-end architecture.
- Architected enterprise quoting platform used by 300+ users across branches and 7 corporate teams, processing 30–40 quotes ($10K to $1M) daily with role-based access control mapped from Azure AD security teams to Dataverse security roles.
- Designed complex equipment configuration integration with parent company build system via API Management and Azure Functions, enabling secure JSON ingestion using application user authentication and automated Dataverse asset creation.
- Extended Model-Driven forms using custom Ribbon Workbench commands, Web Resources, and Canvas custom pages to trigger plugin-based APIs and Azure Function integrations for document generation workflows.
- Optimized real-time margin and profit calculations by refactoring 7–8 second client-side processing into event-driven Dataverse plugins (<1 second execution), significantly improving quote editing performance.
- Designed advanced UI enhancements using SubGrids (Editable Grid, Power Apps Component Framework-based views) and custom document grid plugin leveraging Dataverse Notes relationships.
- Engineered high-performance document generation pipeline (Quote, PO, Recap) using custom plugin APIs and Azure Functions (HTML/CSS templating), reducing generation time from 2–3 minutes to 3–4 seconds and supporting 3,000+ documents per month.
- Implemented DocuSign lifecycle automation with envelope tracking and status synchronization, integrating multi-stage corporate workflow using Business Process Flows and Teams Adaptive Card approvals.
- Implemented complex form behaviors using executionContext, formContext, addOnStageChange events, and Xrm.WebApi calls to enforce conditional field locking, stage validation, and forward-only BPF progression.
- Automated corporate task orchestration with dynamic stage ownership, 30-day inactivity archival policy, structured timeline auditing, and custom document management UI leveraging Dataverse Notes relationships
- Engineered scheduled Power Automate workflow to aggregate monthly outstanding payment data by branch, delivering consolidated financial summaries to corporate leadership for real-time visibility into receivables and automatically notifying 100+ customers per cycle regarding pending balances.
- Designed and implemented AI Builder document processing solution orchestrated through Power Automate to extract structured data from inbound parts invoices (2–3 daily), generate formatted Excel reports, and distribute summaries to Parts President and branch leadership, reducing 30–40 minutes of daily manual data entry.

LTI Mindtree (Client: Mars Inc) **Jan 2020 – Jul 2022**

Software Engineer (Power Platform Developer)

- Designed, developed, and supported eight PowerApps applications and numerous Power Automate flows to streamline internal processes and customer engagement, integrating these with SharePoint, Microsoft Dataverse, and custom connectors for enhanced data management and system performance.
- Architected and delivered a Canvas-based inspection platform supporting multi-store retail operations across the UK, enabling managers to conduct structured store audits, capture photographic evidence, and submit reports for centralized General Manager review.
- Leveraged SharePoint Online as the primary data layer, implementing SharePoint Security Groups for role-based access control and aligning permissions with existing business governance policies.
- Engineered performance-optimized Canvas logic by applying delegable query patterns, pre-filtering strategies, and controlled delegation handling to maintain responsiveness across large inspection datasets.
- Automated end-to-end inspection report generation using Power Automate, dynamically compiling inspection data and uploaded images into formatted PDF reports and storing them in structured SharePoint folders (date and region-based hierarchy), reducing manual report preparation time by 20–30 minutes per inspection.
- Implemented Azure Security Groups and SharePoint User Groups to manage user access control efficiently, adhering to organizational policies and compliance requirements.
- Authored comprehensive documentation and implemented best practices for Power Platform solutions development, focusing on performance optimization and system responsiveness.
- Regularly developed and demonstrated proofs of concept (POCs) to stakeholders, facilitating strategic decision-making and application scalability.
- Configured and customized SharePoint forms, lists, and workflows within SharePoint Online, ensuring alignment with business process requirements.

EDUCATION:

Master of Science in Computer Science

Florida International University, Miami, Florida **Aug 2022 – May 2024**

Bachelor of Science in Computer Science

VelTech University, Chennai, India **Aug 2016 – May 2020**
